

UNIT - 4

(1)

Elementary

combinatorics (permutations & combinations)

combinatorics :- combinatorics is an important part of discrete mathematics that solves counting problems without actually enumerating all possible cases.

combinatorics deals with counting the number of ways of arranging or choosing objects from a finite set according to certain specified rules.

In other words, combinatorics is concerned with problems of permutations and combinations

permutations :- (arrangement purpose)

An ordered arrangement of n elements of a set containing n distinct elements is an r -permutation of n elements and is denoted by $p(n, r)$ or $n P_r$ where $r \leq n$

$$p(n, r) = n(n-1)(n-2) \cdots (n-r+1)$$

$$\boxed{p(n, r) = \frac{n!}{(n-r)!}}$$

$$p(n, n) = n!$$

combinations : An ordered selection of π elements of a set containing n distinct elements is called an π -combination of n elements and is denoted by $c(n, \pi)$ or $n c_{\pi} (\pi) (n, \pi)$

$$\therefore c(n, \pi) = \frac{n!}{\pi!(n-\pi)!}$$

$$c(n, n) = 1$$

permutation : An arrangement on a set of π elements of a set of n elements is called permutation of elements.

$$n P_{\pi} = \frac{n!}{(n-\pi)!}$$

problems :-

(1) How many can be formed by when repetition

4 digit numbers can be formed using digits 2, 4, 6, 8 allowed.

Say :- Since repetition is allowed, each of the 4 places in a 4 digit number can be filled up in 4 ways by

(2)

The given 4 digits

4 ways

Thousands

4 ways

Hundreds

4 ways

Tens

4 ways

units

The required no. of 4 digit numbers

$$= n^r \Rightarrow 4^4 = 4 \times 4 \times 4 \times 4$$

$$= 256$$

etc.

Example problems on permutations

(1) Number of permutations of n distinct objects (without duplication) :

The number of different arrangements (permutations) of n distinct objects, taken all at a time is

$$P(n,n) = \frac{n!}{(n-n)!} = \frac{n!}{0!} = n!$$

$$\boxed{P(n,n) = n!}$$

(2) Number of permutations of n objects among n distinct objects :

Suppose we are given n distinctly
and wish to arrange n of the objects
denoted by

$$P(n, r) = \frac{n!}{(n-r)!} \quad n P_r = P(n, r)$$

(3) Number of permutations of n distinctly
objects (with duplication) :-

It is required to find the no. of
permutations that can be formed from a
collection of n objects of which n_1 are of
one type, n_2 are of a second type, ..., n_k are
of k^{th} type with $n_1 + n_2 + \dots + n_k = n$
then the no. of permutations of n objects
are

$$\frac{n!}{n_1! \times n_2! \times \dots \times n_k!}$$

(i) circular permutation :- permutations on
a circle are called circular permuta-
tion.

The tot no. of ways of arranging
the n polygons in a circle $= (n-1)!$

Here n is the no. of permutations

problems

(3)

① How many ways are there to sit 10 boys and 10 girls around a circular circular table?

Sol: - Here ^{10 Boys} & 10 girls are sit around a circle circular table.

Total no. of persons = $10+10 = 20$
 $n = 20$

The total no. of ways of arranging persons = $(n-1)!$
 $= (20-1) ! = 19! \Rightarrow 19! \leftarrow$

② How many ways are there to sit 3 around a round table?

Sol: - No. of persons $n = 3$
The total no. of ways of arranging persons around a round table
 3 persons $(n-1) ! = (3-1) ! = 2 ! \Rightarrow 2$
 $=$

③ How many different arrangements of letters in the word BOUGHT?

Sol: - The given word contains BOUGHT
The word contains 6 letters that are distinct
containing (without repetition)

The tot no. of arrangements of letters
in the word BOUGHT = $P(n,n) = n!$
= $6! = 6 \times 5 \times 4 \times 3 \times 2 \times 1$
= 720

(4) How many different strings of length 4 can be formed using the letters of the word PROBLEM?

Sol :-
The given word PROBLEM has 7 letters. ∴ $n = 7$
The no. of different strings of length 4 can be formed by using the letters of the word PROBLEM = $P(n,r) = P(7,4) = \frac{7!}{(7-4)!} = \frac{7!}{3!} = \frac{7 \times 6 \times 5 \times 4 \times 3!}{3!} = 840$

(5) How many words of three distinct letters can be formed from the letters of the word PASCAL.

Sol :- The given word PASCAL contains 6 letters
∴ $n = 6$
 $P(n,r) = P(6,3) = \frac{6!}{(6-3)!} = \frac{6!}{3!}$

$$= \frac{6 \times 5 \times 4 \times 3!}{3!} = 120 \text{ ways.}$$

(4)

\therefore the no. of ways 3 distinct letters can be formed by using the letters of the word PASCAL = 120 ways.

(5) Find the no. of permutations of the letters of the word ENGINEERING.

Sol: - The given word which has 11 letters out of the word ENGINEERING has

$$E = 3 (n_1)$$

$$N = 3 (n_2)$$

$$I = 2 (n_3)$$

$$G = 2 (n_4)$$

$$R = 1 (n_5)$$

\therefore total no. of permutations of the word ENGINEERING =

$$= \frac{n!}{n_1! \times n_2! \times n_3! \times n_4! \times n_5!}$$

$$= \frac{11!}{3! \times 3! \times 2! \times 2! \times 1!}$$

$$= \frac{11!}{6 \times 6 \times 4} \Rightarrow \frac{11 \times 10 \times 9 \times 8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{6 \times 6 \times 4} = 3,70,200$$

H.W
① Find permutations of

$$(a) \text{ SUCCESS} = \frac{7!}{3! \times 2! \times 1! \times 1!} = 420$$

$$(b) \text{ STRUCTURES} = \frac{10!}{3! \times 2! \times 2! \times 2! \times 1!} = 2,126,800$$

$$(c) \text{ MATHEMATICS} = \frac{11!}{2! \times 2! \times 2! \times 4! \times 1!} = 49,89,600$$

② Prove that $(2n)! = 2^n n! \{1.3.5 \dots (2n-1)\}$

$$\begin{aligned} \text{L.H.S. } (2n)! &= 2n(2n-1)(2n-2) \dots 5.4.3.2.1 \\ &= [2^n (2n-2) \dots 4.2] (2n-1)(2n-3) \dots 5.3.1 \\ &= [2^{n-2}(n-1) \dots 2.1] \\ &= [2^n (n-1) 2(2n-2) \dots 2(2 \cdot 1)] [1.3.5 \dots (2n-3)(2n-1)] \\ &= 2^n (n!) [1.3.5 \dots (n-3)(2n-1)] \end{aligned}$$

∴ \therefore L.H.S. = R.H.S.

② If $n P_2 = 72$ find the value of n .

$$\text{S.P. :- Here } n P_2 = 72 \Rightarrow \frac{n!}{(n-2)!} = 72$$

$$\frac{n(n-1) \cancel{(n-2)!}}{\cancel{(n-2)!}} = 72$$

$$n(n-1) = 72$$

$$n^2 - n = 72 \Rightarrow n^2 - n - 72 = 0$$

$$n^2 - 9n + 8n - 72 = 0$$

(5)

$$n(n-9) + 8(n-9) = 0$$

$$(n+8)(n-9) = 0$$

$$n = -8, n = 9$$

But $n \neq -8$ (n cannot be negative)

$$\therefore \boxed{n = 9}$$

Q If $\frac{2n+1}{P_{n-1}} : \frac{2n-1}{P_n} = \frac{3}{5}$ find n ?

~~Q~~ $\frac{2n+1}{P_{n-1}} = \frac{(2n+1)!}{(n+2)!}$ and $\frac{2n-1}{P_n} = \frac{(2n-1)!}{(n-2)!}$

$$\therefore \frac{2n+1}{P_{n-1}} : \frac{2n-1}{P_n} = \frac{(2n+1)!}{(n+2)!} \cdot \frac{(n-2)!}{(2n-1)!} = \frac{3}{5}$$

$$\frac{(2n+1-n+1)!}{(2n-1)!} = \frac{3}{5}$$

$$\frac{(2n+1-n+1)!}{(2n-1)!} = \frac{3}{5}$$

$$\frac{(2n+1)!}{(n+2)!} \cdot \frac{(n-1)!}{(2n-1)!} = \frac{3}{5}$$

$$\frac{(2n+1)(2n+1-1)}{(n+2)} \cdot \frac{(2n+1-2)!}{(n+2-1)} \cdot \frac{(n-2)!}{(n+2-3)!} \cdot \frac{(n-1)!}{(2n-1)!} = \frac{3}{5}$$

$$\frac{(2n+1)(2n)(2n-1)!}{(n+2)(n+1)(n)(n-1)!} \cdot \frac{(n-1)!}{(2n-1)!} = \frac{3}{5}$$

$$\frac{(4n+2)}{(n^2+3n+2)} = \frac{3}{5}$$

$$\begin{aligned} \text{e)} \quad 20n+10 &= 3n^2+9n+6 \\ \Rightarrow 3n^2+9n-20n+6-10 &= 0 \\ \Rightarrow 3n^2-11n-4 &= 0 \end{aligned}$$

$$(n-u)(3n+1) = 0$$

$$\therefore n=4, \text{ & } -\frac{1}{3}$$

~~3 cases~~

$$\text{But } n \neq -\frac{1}{3} \therefore n=4$$

Q3 In how many ways can the letters of the word DISCRETE come together?

Sol :- no. of letters in the given word $n=8$
 no. of vowels in the word $= 3$
 \therefore The required number $= 3! \times (8-3)! = 3! \times 5! = 720$

Q4 In how many ways can 7 boys and 5 girls be seated in a row so that no two girls may sit together.

Sol :- Since there is no restriction on boys, first of all we fix the position of 7 boys.

Their positions are indicated as

$$x B_1 x B_2 x B_3 x B_4 x B_5 x B_6 x B_7 x$$

7 boys can be arranged in 7! ways.

(6)

Now if 5 girls sit at places including the two ends indicated by X, then no two of the 5 girls will sit together.

clearly, 5 girls can be seated on 8 places in $8P_5$ ways.

Hence the required no. of ways of seating 7 boys and 5 girls under the given condition = $8P_5 \times 7!$

$$= \frac{8!}{3!} \times 7!$$

$$= 8! \times \frac{7 \times 6 \times 5 \times 4 \times 3!}{3!}$$

$$= 40320 \times 24$$

$$= 96768$$

Combinations (With repetition) ⑦

Suppose we wish to select a combination of r objects with repetition from a set of n distinct objects. The no. of such selections is given by

$$C(n+r-1, r) = C(r+n-1, n-1)$$

→ The following are the other interpretations of this

(i) $C(n+r-1, r) = C(r+n-1, n-1)$ represents the no. of ways in which r identical objects can be distributed among n distinct containers.

(ii) $C(n+r-1, r) = C(r+n-1, n-1)$ represents the no. of non-negative integral solns of the equation

Eg:- In how many ways can 20 similar books be placed on 5 shelves?

Ans

$$r=20, n=5$$

Sol:-

$$\begin{aligned} \text{Req. no. of ways} &= C(n+r-1, r) \\ &= C(5+20-1, 20) \\ &= C(24, 20) \\ &= 701,626 \end{aligned}$$

\downarrow
 n - distinct elements
 r - identical objects w.r.t.
 i) no. of such selections
 $C(n+r-1, r) = C(r+n-1, n-1)$
 n distinct
identical
objects
 no. of
non-negative
integers
 pairings

Note :- A non-negative integer solution of the equation $n_1 + n_2 + \dots + n_n = r$ is an n -tuple, where $n_1, n_2, n_3, \dots, n_n$ are non-negative integers & whose sum is r .

Eg:- ① In how many ways can we distribute 6 distinct marbles among 10 identical containers?

Sol :- By comparing

$$\begin{aligned}
 & \text{no. of ways} \quad \text{no. of ways} \\
 & 10 \text{ identical containers} \quad 10 \text{ distinct containers} \\
 & 6 \text{ distinct marbles} \quad r = 10 \\
 & \text{selecting} \quad n = 6 \\
 & \text{no. of each} \quad \text{no. of ways} \\
 & c(r+n-1, r) = c(10+6-1, 10) \\
 & = c(15, 10) \\
 & = \frac{15!}{10! 5!} \\
 & = 3003
 \end{aligned}$$

integer

Eg ② : Find the no. of non-negative integer solutions

$$\begin{aligned}
 & \text{sum of non-negative integers} \\
 & \text{is } n_1 + n_2 + n_3 + n_4 + n_5 = 8 \\
 & \text{no. of non-negative integers} \quad n=5 \\
 & \text{no. of non-negative integers} \quad r=8 \\
 & c(n+r-1, r) = c(5+8-1, 8) \\
 & = c(12, 8) \\
 & = \frac{12!}{8! 4!} = 495
 \end{aligned}$$

(3) In how many ways can we distribute 12 identical pencils to 5 children so that every child gets at least one pencil?

Sol :- No. of pencils = 12

No. of children = n = 5

every child gets atleast one pencil
mean \times each child may get ≥ 1 pencil

First, we distribute one pencil to each child, then the remaining

identical pencils ($12-5=7$) can be distributed to 5 children.

\therefore no. of ways to distribute 7 identical pencils to 5 children =

$$c(n+r-1, r) = c(7+5-1, 7)$$

$$= c(11, 7)$$

$$= \frac{11!}{7!4!}$$

$$= 330 \text{ ways.}$$

(4) In how many ways can we distribute 7 apples and 6 oranges among 4 children so that each child gets one apple?

Sol :- No. of apples = 7

No. of oranges = 6
 No. of children = 4
 each children gets atleast one apple,
 i.e. every apple may get ≥ 1 apple.

first we distribute one apple to
 each child. The remaining apples
 $\Rightarrow 4 - 3 = 1$ can be distributed to 4
 children.

No. of ways
 to 4 children

day to buck 3 apples

$$c(3 + (n-1), n)$$

$$= c(3 + (4-1), 3) \quad n=3 \\ n=4$$

$$= c(6, 3)$$

$$= \frac{6!}{3! 3!}$$

$$= 20 \text{ ways.}$$

No. of ways to children = $c(r + n - 1, r)$

$$= c(6 + 4 - 1, 6) \quad n=6 \\ n=4$$

$$= c(9, 6)$$

$$= \frac{9!}{6! 3!}$$

$$= 84 \text{ ways}$$

\therefore Total no. of ways to distribute
 among under given condition 84 ways

→ find the no. of positive integer solutions of the equation
 $x_1 + x_2 + x_3 = 17$ where $x_1 \geq 1, x_2 \geq 1, x_3 \geq 1$

Sol:- Given equation $x_1 + x_2 + x_3 = 17$

where $x_1 \geq 1, x_2 \geq 1, x_3 \geq 1$

let us consider three non-negative integers

y_1, y_2 and y_3

$$y_1 = x_1 - 1 \Rightarrow x_1 = y_1 + 1$$

$$y_2 = x_2 - 1 \Rightarrow x_2 = y_2 + 1$$

$$y_3 = x_3 - 1 \Rightarrow x_3 = y_3 + 1$$

The above eqn can be defined in terms

of y_1, y_2, y_3

$$x_1 + x_2 + x_3 = 17$$

$$(y_1 + 1) + (y_2 + 1) + (y_3 + 1) = 17$$

$$y_1 + y_2 + y_3 + 3 = 17$$

$$y_1 + y_2 + y_3 = 14$$

$$\therefore y_1 + y_2 + y_3 = 14$$

no. of positive integer solns of the
 above equation = $C(n+r-1, r)$

$$= C(3+14-1, 14)$$

$$\begin{matrix} n=3 \\ r=14 \end{matrix}$$

$$= C(16, 14)$$

$$= \frac{16!}{14! 2!}$$

$$= 120$$

∴ no. of positive integer solns of the given eqn = 120

H.C.W

\rightarrow Find the no. of integer soln of
 $n_1 + n_2 + n_3 + n_4 + n_5 = 30$
 To eqn where $n_1 \geq 2, n_2 \geq 3, n_3 \geq 4, n_4 \geq 1, n_5 \geq 0$

Sol:- Given equation $n_1 + n_2 + n_3 + n_4 + n_5 = 30$

Let us consider the integers

$$y_1, y_2, y_3, y_4 \& y_5$$

$$\text{Now let us set } y_1 = n_1 - 2 \Rightarrow n_1 = y_1 + 2$$

$$y_2 = n_2 - 3 \Rightarrow n_2 = y_2 + 3$$

$$y_3 = n_3 - 4 \Rightarrow n_3 = y_3 + 4$$

$$y_4 = n_4 - 1 \Rightarrow n_4 = y_4 + 1$$

$$y_5 = n_5 \Rightarrow n_5 = y_5$$

The above eqn can be written as

$$n_1 + n_2 + n_3 + n_4 + n_5 = 30$$

$$(y_1+2) + (y_2+3) + (y_3+4) + (y_4+1) + y_5 = 30$$

$$y_1 + y_2 + y_3 + y_4 + y_5 = 30 - 11 = 19$$

$$\therefore y_1 + y_2 + y_3 + y_4 + y_5 = 19$$

The no. of integer soln of the abv

$$\text{eqn} = C(n+5-1, 5)$$

$$= C(5+19-1, 19)$$

$$= C(23, 19)$$

$$= \frac{23!}{19! 4!} = 8855$$

$$\begin{matrix} n=5 \\ 5+19-1 \end{matrix}$$

Properties

(10) (P)

$$\textcircled{1} \quad nC_r = nC_{n-r} \quad (0 \leq r \leq n)$$

sol :- we have $nC_{n-r} = \frac{n!}{(n-r)! (n-n+r)!}$

$$= \frac{n!}{(n-r)! r!} = nC_r$$

$$\textcircled{2} \quad nC_r + nC_{r-1} = n+1C_r \quad (0 \leq r \leq n)$$

sol :- $nC_r + nC_{r-1} = \frac{n!}{r! (n-r)!} + \frac{n!}{(r-1)! (n-r+1)!}$

$$= n! \left[\frac{1}{r! (n-r)!} + \frac{1}{(r-1)! (n-r+1)!} \right]$$

$$= n! \left[\frac{1}{(n-r)! r! (r-1)!} + \frac{1}{(n-r+1) (n-r+1-1)! (r-1)!} \right]$$

$$= n! \left[\frac{1}{r (r-1)! (n-r)!} + \frac{1}{(n-r+1) (n-r)! (r-1)!} \right]$$

$$= \frac{n!}{(n-r)! (r-1)!} \left[\frac{1}{r} + \frac{1}{n-r+1} \right]$$

$$= \frac{n!}{(n-r)! (r-1)!} \left[\frac{n-r+1+r}{r (n-r+1)} \right]$$

$$= \frac{n!}{(n-r)! (r-1)!} \left[\frac{(n+1)}{r (n-r+1)} \right]$$

$$= \frac{(n+1) n!}{n! (n-1)! (n-\cancel{n+1}) (n-\cancel{n})!}$$

$$= \frac{(n+1)!}{n! (n-\cancel{n+1})!}$$

$${}^n C_n + {}^n C_{n-1} = {}^{n+1} C_n$$

$\Leftarrow ..$

$$\textcircled{3} \quad {}^n C_n = {}^n C_y \Rightarrow n=y \text{ & } n+y=n$$

Sy :- we have ${}^n C_n = {}^n C_y$

$$\Rightarrow {}^n C_n = {}^n C_{n-y} \quad [{}^n C_n \geq {}^n C_{n-y}]$$

$$\Rightarrow n=y \quad (\text{S}) \quad n=n-y$$

$$\Rightarrow n=y \quad (\text{S}) \quad n+y=n.$$

Relation b/w ${}^n C_n$ and ${}^{n+1} C_n$

$$\frac{{}^{n+1} C_n}{{}^n C_n} = \frac{\frac{(n+1)!}{n! (n+1-n)!}}{\frac{n!}{n! (n-n)!}} \stackrel{?}{=} \frac{(n+1)!}{\cancel{n!} (n+1-n)!} \times \frac{\cancel{n!} (n-n)!}{n!}$$

$$= \frac{(n+1) (n+1-1)!}{(n+1-n) (n+1-n-x)!} \times \frac{(n-x)!}{x! n!}$$

$$= \frac{(n+1) n!}{(n+1-n) (n-n)!} \times \frac{(n-n)!}{n!}$$

$$= \frac{n+1}{(n+1-n)}$$

(1) Evaluate the following

(1)

$$(i) {}^6C_3 = \frac{6!}{3!(6-3)!} = \frac{6!}{3!3!} = \frac{6 \times 5 \times 4 \times 3 \times 2 \times 1}{3 \times 2 \times 1 \times 3 \times 2 \times 1} = 20$$

$$(ii) {}^{10}C_{10-8} = {}^{10}C_2 \Rightarrow {}^{10}C_2 \\ = \frac{10!}{2!8!} = 45$$

(2) Compute 8P_5 & 6C_3

$$\text{sol: } {}^8P_5 = \frac{8!}{(8-5)!} = \frac{8!}{3!} = \frac{8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{3!} \\ = 6720$$

$${}^6C_3 = \frac{6!}{3!(6-3)!} = \frac{6!}{3!3!} = 20.$$

(3) ${}^{18}C_{2r} = {}^{18}C_{r+2}$ find the value of 8C_5

$$\text{sol: } \therefore {}^nC_r = {}^nC_{n-r} \Rightarrow r + n - r = n$$

$$\text{so } r + r + 2 = 18 \Rightarrow 2r + 2 = 18 \\ \Rightarrow r + 1 = 9 \\ \Rightarrow r = 8$$

$$\therefore {}^8C_5 = {}^8P_5 = \frac{8!}{5!3!} = \frac{8!}{5!3!} = \frac{8 \times 7 \times 6 \times 5 \times 4 \times 3 \times 2 \times 1}{5!3!3 \times 2 \times 1} \\ = 56$$

H.W

Pg-429
 → Find the no. of integer pairs of x_1, x_2, x_3, x_4, x_5 such that
 where $x_1 \geq 2, x_2 \geq 3, x_3 \geq 4, x_4 \geq 2, x_5 \geq 0$ and $x_1 + x_2 + x_3 + x_4 + x_5 = 30$

(4) If ${}^n C_n = 56$ & ${}^n P_n = 336$ find n

$$\text{Sol: } {}^n C_n = 56 \Rightarrow \frac{n!}{n!(n-n)!} = 56$$

$${}^n P_n = 336 \Rightarrow \frac{n!}{(n-n)!} = 336.$$

$$\frac{{}^n C_n}{{}^n P_n} = \frac{56}{336} \Rightarrow \frac{\cancel{n!}}{n!(n-n)!} \times \frac{(n-n)!}{n!} = \frac{56}{336} = \frac{1}{6}$$

$$= \frac{1}{n!} = \frac{1}{6}$$

$$n! = 3!$$

$$\boxed{n = 3}$$

Again ${}^n P_n = 336$

$${}^n P_3 = 336. \Rightarrow \frac{n!}{\cancel{3!}(n-3)!} = 336$$

$$\frac{n(n-1)(n-2)(n-3)!}{(n-3)!} = 336$$

$$n(n-1)(n-2) = 8 \times 7 \times 6$$

$$\therefore \boxed{n = 8}$$

(5) If ${}^{1000} C_{98} = 999 {}^n C_{97} + {}^n C_{901}$; find n

$$\text{Sol: } \text{Here } {}^{1000} C_{98} = 999 {}^n C_{97} + {}^n C_{901}$$

$$(31) \quad {}^{1000} C_{902} = 999 {}^n C_{902} + {}^n C_{901} \quad [{}^n C_r = {}^n C_{n-r}]$$

$$(37) \quad 999 + {}^n C_{902} = 999 {}^n C_{902} + {}^n C_{902-1}$$

(19)

$$n! C_9 = nC_9 + nC_{9-1}$$

$$\therefore n = 999$$

6) In how many ways can 4 questions be selected from 7 questions?

Sol :- The required no. of ways

$$7C_4 = \frac{7!}{4!(7-4)!} = \frac{7!}{4!3!} = 35$$

7) In how many ways can you select at least one king, if you choose five cards from a deck of 52 cards?

Sol :- There are 4 kings in a deck of 52 cards

$$\text{No. of ways of choosing 1 king} = 4C_1 \times 48C_4$$

$$\text{“ “ “ “ “ “ } 2 \text{ “ } = 4C_2 \times 48C_3$$

$$\text{“ “ “ “ “ “ } 3 \text{ “ } = 4C_3 \times 48C_2$$

$$\text{“ “ “ “ “ “ } 4 \text{ “ } = 4C_4 \times 48C_1$$

, the required number $4C_1 \times 48C_4 + 4C_2 \times 48C_3 +$

$$4C_3 \times 48C_2 + 4C_4 \times 48C_1$$

$$= 886,656$$

Note: Total no. of ways in which one or more things are taken $2^n - 1$

Eg:- ① You have 4 friends, in how many ways can you invite one or more them for dinner?

Sol:- You may invite 1, 2, 3, or 4 of your friends to dinner. Hence the required no. of ways $= 2^n - 1$

$$= 2^4 - 1$$

$$= 63.$$

② There are 5 questions in a question paper. In how many ways can a boy solve one or more questions?

Sol:- $2^5 - 1 = 31$

Note:- The selection made of things is where P, Q, R, \dots of third kind and so on, the tot. no. of possible selections is $[P+1] [Q+1] [R+1] \dots - 1$

Eg:- In how many ways can a selection be made out of 3 mangoes, 5 oranges and 2 apples?

$$P = 3, Q = 5, R = 2$$

Sol:- Here \therefore Req. no. of combinations $= (3+1)(5+1)(2+1) - 1$
 $= 4 \cdot 6 \cdot 3 - 1$
 $= 72 - 1 = 71$

pigeonhole principle

(13)

pigeonhole principle : — If n pigeons are accommodated in m pigeonholes and $n > m$ then at least one pigeonhole will contain two or more pigeons.

Generalized pigeonhole principle :

If n pigeons are accommodated in m pigeonholes and $n > m$ then one of the pigeonholes must contain at least $\left[\frac{n-1}{m}\right] + 1$ pigeons.

Eg:- ① In any set of 29 persons at least 5 persons must have been born on the same day of the week.

Sol:- A week contains 7 days : 7 pigeon holes

a set of 29 persons : 29 pigeons

According to generalized pigeonhole principle

$$\left(\frac{n-1}{m}\right) + 1 \Rightarrow \frac{29-1}{7}$$

$$n = 29$$

$$m = 7$$

$$= \frac{28}{7} = 4$$

Among a set of 29 persons, 5 persons must have been born on the same day of the week.

(2) Find the minimum no. of students in a class to be sure that four out of them are born ~~in~~ on the same day of a week.

Sol:- we consider each month as a pigeonhole. Then $m = 12$
 we have to find the minimum no. of students (pigeons)
 so that four out of them are born in the same month.

$$\left\lceil \frac{n-1}{m} \right\rceil + 1 = 4$$

$$\frac{n-1}{m} = \frac{3}{1} \Rightarrow 3m = n-1$$

$$3(12) = n-1$$

$$36+1 = n \Rightarrow n = 37$$

\therefore which is the min. no. of students
 If 9 books are to be kept in 4 shelves,
 then must be atleast one shelf which contains
 at least 3 books.

Sol:- $n = 9, m = 4$

By pigeon hole principle $\left(\frac{n-1}{m}\right) + 1 = 3$

$$\begin{aligned} \left(\frac{9-1}{4}\right) + 1 &= 3 \\ \frac{8}{4} + 1 &= 3 \\ 2 + 1 &= 3 \end{aligned}$$

so at least $\frac{1}{2}$ of the persons have
 atleast one shelf will contain
 atleast 3 books.

(14)

principle of Inclusion-Exclusion

If A & B are any two finite sets $\left\{ \begin{array}{l} A = \{a, b, c\} \\ |A| = 3 \\ \text{cardinality of } A \end{array} \right.$

Then $|A \cup B| = |A| + |B| - |A \cap B|$ where $|A|$ denotes the cardinality of A .

If A, B, C are any 3 sets,

$$|A \cup B \cup C| = |A| + |B| + |C| - |A \cap B| - |B \cap C| - |A \cap C| + |A \cap B \cap C|$$

If A and B are two disjoint sets

$$\text{then } |A \cup B| = |A| + |B|$$

for generalisation if A_1, A_2, \dots, A_n are

finite sets then

$$|A_1 \cup A_2 \cup \dots \cup A_n| = \sum_{i=1}^n |A_i| - \sum_{1 \leq i < j \leq n} |A_i \cap A_j| + \sum_{1 \leq i < j < k \leq n} |A_i \cap A_j \cap A_k| - \dots + (-1)^{n+1} |A_1 \cap A_2 \cap \dots \cap A_n|$$

\vdots formula for the no. of elements

Give a formula for four sets.

eg:- ① find the union of four sets A_1, A_2, A_3, A_4

$$\text{Sol: } |A_1 \cup A_2 \cup A_3 \cup A_4| = |A_1| + |A_2| + |A_3| + |A_4| - |A_1 \cap A_2| - |A_1 \cap A_3| - |A_1 \cap A_4| - |A_2 \cap A_3| - |A_2 \cap A_4| - |A_3 \cap A_4| + |A_1 \cap A_2 \cap A_3| + |A_1 \cap A_2 \cap A_4| + |A_1 \cap A_3 \cap A_4| + |A_2 \cap A_3 \cap A_4| - |A_1 \cap A_2 \cap A_3 \cap A_4|$$

$$\begin{aligned}
 & - |A_1 \cap A_2| - |A_1 \cap A_3| - |A_1 \cap A_4| - |A_2 \cap A_3| - |A_2 \cap A_4| - \\
 & [A_3 \cap A_4] + |A_1 \cap A_2 \cap A_3| + |A_1 \cap A_2 \cap A_4| + \\
 & |A_1 \cap A_3 \cap A_4| + |\cancel{A_2 \cap A_3 \cap A_4}| + |A_2 \cap A_3 \cap A_4| - \\
 & |A_1 \cap A_2 \cap A_3 \cap A_4|
 \end{aligned}$$

problems

(i) In a sample of 200 logic chips, 16 have a defect D_1 , 52 have a defect D_2 , 60 have a defect D_3 , 14 have defects A and D_3 ; 20 have defects D_2 and D_3 , and 3 have all the three defects. Find the no. of chips having at least one defect.

(ii) At least one defect;

say, let U denotes the set of all chips in a given sample, and A, B, C denote the set of chips having defects D_1, D_2, D_3 respectively.

Then we have

$|U| = 200$, $|A| = 16$, $|B| = 52$, $|C| = 60$, $|A \cap B| = 14$, $|A \cap C| = 16$, $|B \cap C| = 20$ and $|A \cap B \cap C| = 3$

(i) The set of chips having at least one defect is $A \cup B \cup C$

∴ the no. of chips having at least one defect = $|A \cup B \cup C|$

$$\begin{aligned}
 &= |A| + |B| + |C| - |A \cap B| - |B \cap C| - |C \cap A| + \\
 &\quad |A \cap B \cap C| \\
 &= 46 + 52 + 60 - 14 - 16 - 20 + 3 \\
 &= 161 - 50 \\
 &= 111
 \end{aligned}$$

② wrote the principle of Inclusion-Exclusion from a group of 10 professors. How many ways can committees of 5 members be formed so that at least one professor will be excluded.

A and professor B

say : - To tot no. of committees $c(10, 5)$
Let A & B be the sets of committees
that include professor A and professor B

respectively

$$\text{Then } |A| = c(9, 4)$$

$$|A \cap B| = c(8, 3)$$

By the principle of the Inclusion-Exclusion

$$\begin{aligned}
 |A \cup B| &= |A| + |B| - |A \cap B| \\
 &= c(9, 4) + c(9, 4) - c(8, 3) \\
 &= 2c(9, 4) - c(8, 3)
 \end{aligned}$$

$$= 2 \times \frac{96}{4!5!} - \frac{8!}{3!5!}$$

$$= 2 \times \frac{9 \times 8 \times 7 \times 6}{24} - \frac{8 \times 7 \times 6}{6}$$

$$= 252 - 56$$

$$= 196.$$

Q3 How many integers between 1 & 300 (inclusive) are divisible by at least one of 5, 6 and 8.

Sol :- Let $S = \{1, 2, 3, \dots, 300\}$ then

$|S| = 300$
 Let A, B, C be the subset of S whose elements are divisible by 5, 6, 8 respectively.
 Then we have.

$$|A| = \left\lfloor \frac{300}{5} \right\rfloor = 60, \quad |B| = \left\lfloor \frac{300}{6} \right\rfloor = 50$$

$$|C| = \left\lfloor \frac{300}{8} \right\rfloor = 37, \quad |A \cap B| = \left\lfloor \frac{300}{30} \right\rfloor = 10$$

$(\because \text{Lcm of } 5, 6, 8 \text{ is } 30)$

$$|A \cap C| = \left\lfloor \frac{300}{40} \right\rfloor = 7, \quad |B \cap C| = \left\lfloor \frac{300}{24} \right\rfloor = 12$$

$(\because \text{Lcm of } 6, 8, 12 \text{ is } 24)$

$$\text{and } |A \cap B \cap C| = \left\lfloor \frac{300}{120} \right\rfloor = 2 \quad (\because \text{Lcm of } 5, 6, 8 \text{ is } 120)$$

By the principle of inclusion exclusion (16)

we have

$$\begin{aligned}|A \cup B \cup C| &= |A| + |B| + |C| - |A \cap B| - |B \cap C| \\&\quad - |C \cap A| + |A \cap B \cap C| \\&= 60 + 50 + 37 - 10 - 7 - 12 + 2 \\&= 120\end{aligned}$$

thus 120 elements of S are divisible by at least one of 5, 6, 8

BINOMIAL THEOREM

A Binomial theorem describes the algebraic expansion of powers of a binomial with two variables.

$$(x+y)^n = nC_0 x^n y^0 + nC_1 x^{n-1} y^1 + nC_2 x^{n-2} y^2 + \dots$$

$$\dots + nC_{n-1} x^1 y^{n-1} + nC_n x^0 y^n$$

If can be written as

$$(x+y)^n = \sum_{r=0}^{\infty} nC_r x^{n-r} y^r$$

$$\begin{aligned}(1+x)^n &= nC_0 1^n x^0 + nC_1 1^{n-1} x^1 + nC_2 1^{n-2} x^2 + \\&\quad nC_3 1^{n-3} x^3 + \dots\end{aligned}$$

$$\begin{aligned}
 & \Rightarrow nC_0 x^0 + nC_1 x^1 + nC_2 x^2 + nC_3 x^3 + \dots \\
 & \Rightarrow 1 + x + \frac{n!}{1!(n-1)!} x^2 + \frac{n!}{2!(n-2)!} x^3 + \frac{n!}{3!(n-3)!} x^4 - \\
 & \Rightarrow 1 + \frac{n(n-1)!}{(n-1)!} x + \frac{n(n-1)(n-2)!}{2!(n-2)!} x^2 + \frac{n(n-1)(n-2)(n-3)!}{3!(n-3)!} x^3 + \dots \\
 & \frac{n(n-1)(n-2)(n-3)!}{3!(n-3)!} x^3 + \dots \\
 & (Hx)^n = 1 + nx + \frac{n(n-1)}{2!} x^2 + \frac{n(n-1)(n-2)}{3!} x^3 + \dots
 \end{aligned}$$

problem :-

① find out

the coefficient of $x^9 y^3$

1 theorem

say :- we know that Binomial
 $(x+y)^n = \sum_{r=0}^{\infty} nCr x^{n-r} y^r$ according to the Binomial theorem

according compare with $(x+2y)^{12}$

$x = x$, $y = 2y$, $n = 12$

$$\begin{aligned}
 (x+2y)^{12} &= \sum_{r=0}^{\infty} {}^{12}C_r (x)^{12-r} (2y)^r \\
 &= \sum_{r=0}^{\infty} {}^{12}C_r x^{12-r} 2^r y^r - \text{①}
 \end{aligned}$$

we have to find out $x^9 y^3$

(17)

$$n^q = x^{12-3} \quad | \quad y^n = y^{q+3} \\ q = 12-3 \quad n = 3$$

$$q = 3$$

n value subsituted in eq ①

$$12C_3 \cdot 2^3 \cdot n^{12-3} \cdot y^3$$

$$12C_3 \cdot 2^3 \cdot n^9 \cdot y^3$$

$$\frac{12!}{3!9!} \times 2^3$$

$$\frac{12 \times 11 \times 10 \times 9!}{46 \times 6 \times 5 \times 4 \times 3}$$

$$= 1760$$

∴ coefficient of $n^9 y^3$ in $(n+2y)^{12}$

∴ 1760 is coefficient of $n^5 y^2$ in

(2)

Find out the coefficient

of $(2n-3y)^7$ from Binomial theorem
we know that,

$$(x+y)^n = \sum_{r=0}^{\infty} nCr x^{n-r} y^r$$

$$n = 2n, y = -3y, n = 7$$

$$(2n-3y)^7 = \sum_{r=0}^{\infty} 7Cr (2n)^{7-r} (-3y)^r \\ = \sum_{r=0}^{\infty} 7Cr 2^{7-r} n^{7-r} (-3)^r y^r \quad \rightarrow ①$$

we have to find out the coefficient of

$$n^5 \cdot y^2$$

$$n^{7-r} = n^5$$

$$7-r = 5$$

$$r = 2$$

$$r = 2$$

$$y^r = y^2$$

$$r = 2$$

$\therefore r$ value suitable on ${}^n C_r$ ①

$${}^7 C_2 (2)^{7-2} (-3)^2 x^{7-2} y^2$$

$$= {}^7 C_2 2^5 9 \cdot n^5 y^2$$

$$\frac{7!}{2! 5!}$$

$$\frac{7 \times 6 \times 5!}{2 \times 1 \times 5!} 32 \cdot 9 \cdot n^5 y^2$$

$$= 21 \times 32 \times 9 \cdot n^5 y^2$$

$$= 6045 n^5 y^2$$

\therefore coefficient of $n^5 y^2$ in $(2x-3y)^7$ is 6045

\therefore what is the coefficient of ny^4 in $(x+y)^6$?

③

$$(x+y)^n = \sum_{r=0}^n {}^n C_r x^{n-r} y^r, n=6 \rightarrow ①$$

$$(x+y)^6 = \sum_{r=0}^6 {}^6 C_r x^{6-r} y^r$$

we have to

$$find out$$

$${}^6 C_r = n^2$$

$$6-r=2$$

$$n^2 y^4$$

$$r = 6-2=4$$

$$r=4$$

$$coefficient of$$

$$y^r = y^4$$

seebstetete these values on eqn ①

$$6C_4 n^{6-4} y^4$$

$$6C_4 n^2 y^4$$

$$\frac{66}{4! 2!} n^2 y^4 \Rightarrow \frac{6 \times 5 \times 4!}{y^6 (2!)^2} = 15$$

④ $x^{101} y^{99}$ in the expansion $(2n-3y)^{200}$?

$$(x+y)^n = \sum_{r=0}^{\infty} nCr n^{n-r} y^r$$

$$n=2n, y=-3y,$$

$$(2n-3y)^{200} = \sum_{r=0}^{\infty} {}^{200}C_r (2n)^{n-r} (-3y)^r \rightarrow ①$$

$$= \sum_{r=0}^{\infty} {}^{200}C_r {}^{200-r} n^{200-r} (-3)^r y^r$$

$$x^{101} = n^{200-r}$$

$$y^r = y^{99}$$

$$200-r=101$$

$$r=99$$

$$200-101=99$$

$$r=99$$

$$x^{200-99} (-3)^{99} (y)^{99}$$

$$\approx {}^{200}C_{99} {}^{200-99} x^{200-99} (-3)^{99} \cdot y^{99} x^{101}$$

$$\approx {}^{200}C_{99} {}^{101} 3^{99} \cdot y^{99} n^{101}$$

$$-{}^{200}C_{99}$$

coefficient of

$$x^{101} y^{99} \therefore -{}^{200}C_{99} {}^{201} 3^{99}$$

Σ

Multinomial Theorem

Multinomial theorem is a generalization of the Binomial theorem with more than two variables.

$$(x_1 + x_2 + \dots + x_m)^n = \sum_{n_1, n_2, \dots, n_k} \frac{n!}{n_1! n_2! \dots n_k!}$$

$$\text{where } n_1 + n_2 + \dots + n_k = n$$

e.g:- (1) compute the following

$$(a) \binom{7}{2, 3, 2}$$

It is in the form of

$$\binom{n}{n_1, n_2, n_3} \text{ where } n_1 + n_2 + n_3 = n$$

By applying the multinomial theorem

$$\frac{n!}{n_1! n_2! n_3!} \Rightarrow \frac{7!}{2! 3! 2!} = 210$$

$$(b) \binom{4}{1, 1, 2}$$

This is in the form of

$$\binom{n}{n_1, n_2, n_3}$$

$$\frac{4!}{1! 1! 2!} = \frac{24}{2} = 12$$

$$(c) \binom{12}{5, 3, 2, 2}$$

It is in the form of

$$\binom{n}{n_1, n_2, n_3}$$

$$\frac{2!}{5! 3! 2! 2!} = 166320$$

(4) what is the coefficient of $x^3y^2z^2$ in $(x+y+z)^9$?

Sol: - By the multinomial theorem $\left(\frac{n!}{n_1! \times n_2! \times n_3!} \right)$

$$\frac{9!}{3! \times 2! \times 2!} = 15120.$$

(5) determine the coefficient of xy^2z^2 in the expansion of $(2x-y-z)^4$

Sol: - Applying multinomial theorem

$$(x_1^{n_1} + x_2^{n_2} + \dots + x_k^{n_k})^n = \frac{n!}{n_1! \times n_2! \times \dots \times n_k!} (x_1^{p_1} (n_2)^{p_2} \dots (n_k)^{p_k})$$

where $n_1 + n_2 + \dots + n_k = n$

$$(2x-y-z)^4$$

given expression

$$n_1 = 2, n_2 = -1, n_3 = -2$$

multinomial theorem

Applying

$$\frac{n!}{n_1! \times n_2! \times n_3!} \cdot (x_1)^{n_1} (x_2)^{n_2} (x_3)^{n_3} = \frac{4!}{n_1! \times n_2! \times n_3!} (2x)^{n_1} (-y)^{n_2} (-z)^{n_3} \quad \rightarrow ①$$

We have to find out the coefficient of

$$xy^2z^2 = x_1^{n_1} x_2^{n_2} x_3^{n_3}$$

$$n_1 = 1$$

$$n_2 = 1$$

$$n_3 = 2$$

substitute n_1, n_2, n_3 value in eqn ①

$$\begin{aligned} & \frac{n!}{n_1! \times n_2! \times n_3!} (2x)^{n_1} (-y)^{n_2} (z)^{n_3} \\ &= \frac{2^4}{4! \times 1! \times 2!} x^{2^4} y^1 z^{1^2} \\ &= 12 \times 2 \cdot x^8 y^1 z^2 \\ &= -24 x^8 y^1 z^2 \text{ if } n_3 = 2 \\ \therefore \text{ coefficient of } n_3^2 &= -24 \end{aligned}$$

② determine the coefficient of $x^3 y^3 z^2$ in the expansion of $(2x-3y+5z)^8$

Sol:- By multinomial theorem

$$\frac{n!}{n_1! \times n_2! \times n_3!} x_1^{n_1} x_2^{n_2} x_3^{n_3}$$

$$\text{compare } n=8, \quad \begin{array}{ll} n_1=3 & x_1=2x \\ n_2=3 & x_2=-3y \\ n_3=2 & x_3=5z \end{array}$$

$$\begin{aligned} & \frac{8!}{3! \times 3! \times 2!} (2x)^3 (-3y)^3 (5z)^2 \\ &= \frac{8!}{3! \times 3! \times 2!} x^3 (-3)^3 y^3 z^2 \\ &= -3024000 x^3 y^3 z^2 \text{ if } n_3^2 = -3024000 \\ \therefore \text{ coefficient of } n_3^2 &= -3024000 \end{aligned}$$

(60)
